oligonuclectides of the present invention (see AAF45151 and AAF45153-
P45161). The method is useful for ameliorating the effects of psoriasis,
ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis,
neoplasias, scleroderma, warts, benign growths, cancers of the skin,
hyperneovascular condition such as a neovascular condition of the retina,
brain or skin, growth factor-mediated malignancies, other sclerotic
disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                    Antisense therapy; antiproliferative; antiinflammatory; antipsoriatic; cytostatic; dermatological; cardiant; virucide; ophthalmological; keloid; skin disorder; Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF binding procein; IGFBP-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba; keatosis; neophasia; scleroderma; wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neobascular condition; hyperplasia; kidney disease;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBP3], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

IGF-I oligonucleotide #802

```
The present invention relates to a method for ameliorating the effects of akin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulan-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBP], which is capable of inhibiting or reducing growth factor mediated cell proliferation, finflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAP45151 and AAP45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, planis, serbornhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina,
                                                                                                 Antisense therapy, antiproliferative, antiinflammatory, antipsoriatic, cytostatic, dermatological, cardiant, virucide, ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor, IGF-1; pityriasis; IGF binding protein, IGFBP-2, IGFBPB3, inflammation, psoriasis; pilaris; growth factor mediated cell proliferation, ichthyosis; serborrhoea; ruba, keratosis; neoplasia; scleroderme, wart; skin cancer; sclerotic disease; hyperneovascular condition; hyperplasia; kidney disease; neobascular condition of the retina; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 15 BP; 4 A; 6 C; 1 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Antisense therapy, antiproliferative, antinflammatory, antipsoriatic, cytostatic; dermatological, cardiant; virucide; ophthalmological, keloid, skin disorder, Insulin-like Growth Factor I receptor; IGF-1; pityriasis; IGF, binding protein; IGFB-2; IGFBP3; inflammation; psoriasis; pilatis; growth factor mediated cell proliferation; ichthyosis; serborrhoea; ruba;

The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBP]-2 or IGFBB3), which is capable of infilammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense oligonuclectide which can be used to design the artisense oligonuclectide which can be used to design the artisense oligonuclectide is useful for ameliorating the effects of psoriasis, colfinyosis, pityriasis, ruba, pilaris, seforthoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a pyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperpooliferation of the inside of blood vessels or any other hyperpoliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                 Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

```
The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]) receptor, IGF binding protein [IGFBP]-2 or IGFBPB], which is capable of inhibiting or reducing growth factor mediated cell proliferation, oligonucleotide which can be used to design the antisense oligonucleotide which can be used to design the antisense oligonucleotides of the present invention (see AAFA5151 and AAFA5153-F45161). The method is useful for ameliorating the effects of psoriasis, inchthyosis, pityriasis, tuba, pliaris, serborrhoea, keloids, keratosis, incoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic messels, the present in the inside of blood
                                                                                                                                                                                                                                                                                                                         Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 15 BP; 4 A; 5 C; 2 G; 4 T; 0 U; 0 Other;

                                                                                                                                                                                                                            The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligomucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFBB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligomucleotide which can be used to design the antisense oligomucleotides of the present invention (see AAF4151 and AAF45153-F45161). The method is useful for amelioarating the effects of psoriasis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, ichthyosis, pityriasis, ruba, pliaris, serborrhoea, keloids, keratosis, hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic
                                                                                                                                           Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme, HCV expression, HCV replication, cirrhosis, virucide, liver failure, hepatocellular carcinoma, HCV infection, drug therapy, type I interferon, interferon alpha, interferon beta, cytostatic, interferon gamma, consensus interferon, hepatotropic, antiinflammatory, substrate, hammerhead ribozyme, HH ribozyme, se.

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV is ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirrhosis, liver failure and/or hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more cher drug therapies, particularly type I interferon. The present sequence represents a substrate for a HCV hammerhead (HH) ribozyme. Note: Some of the sequence data for this patent wis patent was printed specification. The complete sequence data for this patent was contained in electronic format directly from the USPTO web site at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acid, RNA cleavage, Hepatitis C virus infection, HCV ribozyme; HCV expression, HCV replication, cirrhosis; virucide; liver failure, hepatocellular carcinoma, HCV infection, drug therapy; type I interferon, interferon alpha; interferon beta; cytostatic; ss; interferon gamma; consensus interferon; hepatotropic; antiinflammatory.
                                                                                                                                                                                                                                                                                                                                                                   New ribozymes targeting RNA derived from hepatitis C virus inhibit vireplication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat cirthosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are also useful for treating a condition associated with HCV infection in conjunction with one or more other drug therapies, particularly type I interferon, especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was
                                                                                                                    New ribozymes targeting RNA derived from hepatitis C virus inhibit viral replication and are useful to treat hepatitis C virus infections and cirrhosis, liver failure or hepatocellular carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Triplex DNA, internucleoside linkage, oligonucleotide-based diagnosis, triplex binding; absorption matrix; immobilised enzyme; process control; immunoassay reagent; pendant functionality; cation exchange agent; molecular sieve; textile; fibre; film; formed article; ss; polyfunctional surfactant; triplex affinity capture purification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligonucleotide compound with internucleoside linkages useful in oligonucleotide-based diagnosis comprises at least one nucleoside

                                                                                                                                                                                                                                                                                                                                                     The present invention relates to enzymatic nucleic acids which specifically cleave RNA derived from Hepatitis C virus (HCV). The enzymatic nucleic acid or ribozyme is in a hammerhead (HH) or hairpin (HP) motif where the binding arms comprise sequences complementary to one of the substrate sequences defined in the specification. The HCV ribozymes are useful for modulating the expression and/or replication of HCV. They can be used to treat circhosis, liver failure and/or replication of hepatocellular carcinoma. The HCV ribozymes are useful for treating cannot consider the special particularly type I interferon especially interferon alpha, beta or gamma or consensus interferon. The present sequence represents a RNA sequence of unknown function. Note: The present sequence is given in the sequence data but is not mentioned elsewhere in the specification. The complete sequence data for this patent was consensus interfered the elsewhere in the sequence in the user of consensus interfered the present contact of the specification. The complete sequence data for this patent was consensus interfered the elsewhere in the sexpansive consensus interfered the elsewhere in the sexpansive consensus interfered the specification. The complete sequence data for this patent was consensus interfered the elsewhere in the sexpansive consensus interfered the elsewhere in the elsewhere in the elsewhere in the els
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .

linkages comprises at least one nucleoside. The compounds are used in oligonucleotide-based diagnosis to detect presence or absence of target gene sequences to which they specifically bind and separation through triplex binding. They are also useful as linkers or spacers in preparing absorption matrices, immobilised enzymes for process control or immunoassay reagents; as monomers to provide access to polymers having pendant functionalities; as cation exchange agents in the preparation of polyfunctional surfactants. The composition improves triplex and as polyfunctional surfactants. The composition improves triplex affinity capture purification and enhances triplex binding to a polynucleotide represents a novel oligonucleotide capable of binding to a polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound, its salt, solvates, resolved enantiomers or purified diastereomers of formula detailed in the specification. Also included is an oligomer compound comprising a multiplicity of nucleosides linked by
                                                                            The invention describes an oligonucleotide compound with internucleoside
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside compound useful for preparing oligonuclectides which are used for detecting specific DNA duplexes in samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                       .

internucleoside linkages where at least one nucleoside is a modified nucleoside comprising a 2-aminopyridine C-nucleoside or 2-pyridone C-nucleoside, the sales, solvates, resolved enabritiomers or purified diasterecemers. The oligomer is useful for detecting the presence, absence or amount of a particular DNA duplex in a sample suspected of containing DNA. The method involves contacting the sample with the oligomer under conditions where a triple helix is formed between the oligomer under conditions where a triple helix is formed between the oligomer under conditions where a triple helix is formed between the oligomer and the particular DNA duplex. The 2-aminopyridine C-nucleoside or 2-pyridone C-concleoside compound is useful for preparing oligonomic or 2-pyridone C-concleoside compounds useful for preparing oligonomic triplex binding, as monomers to provide access to polymers having unique pendent conclines, as comonomers with monomers, for preparing polymers (which are useful as cation exchange agents in the preparing polymers (which are useful as cation exchange agents in the preparing polymers to polyfunctional surfactants, as phase transfer agents, in phase transfer catalysis and liquid/liquid on extraction, in the synthesis or resolution of other optically active matericals, and as linkers or spacers in preparing affinity absorption matrices, immobilised enzymes for in preparing affinity absorption matrices, immobilised enzymes for target sequence (contained in a 370bp restriction fragment) for modified oligonucleosides containing 2-aminopyridine C-nucleoside or 2-pyridone C-mucleosides, used in a DNase footprint assay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to novel nuclease-resistant oligomeric compounds. The compounds of the invention are useful as pharmaceuticals for topical administration such as transdermal patches. The oligomeric compound is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nuclease-resistant oligomeric compound useful as pharmaceuticals for topical administration such as transdermal patches.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Nuclease resistant; ds; pharmaceutical; topical administration; transdermal patch; enzymatic degradation resistant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0

The invention relates to a novel method for determining whether a treatment is effective in changing a status of a certain set of target cells in an individual. The method comprises obtaining a sample from an individual after initiation of the treatment, and determining whether the sample comprises an expression produce of at least one marker gene. The sample comprises an expression produce (which can bind to the protein derived from the marker gene of the invention) are useful for determining whether a treatment is effective in counteracting a tumour in an individual, especially Kaposi's Sarcoma. Peripheral blood mononclear cell (PBMC) expressed keratin 14, TIE 1, Salicadhesin, or Siglec 1 sequences or a fully defined sequence given in the specification, or their analogues are useful as indicactors for angiogenesis and for their analogues are useful as indicactors for angiogenesis and for detecting the presence of a tumour cell in an individual. The expression product of a gene comprising a marker gene of the invention is useful as a drug target. The compound is useful for preparing a medicament. This polynucleotide sequence represents a tag sequence which showed over-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Determining whether a treatment is effective in changing a status of a certain set of target cells in an individual comprises determining whether the sample comprises an expression product of at least one marker

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This invention relates to a polypeptide (I) with beta-1,3 galactose transferase activity, or variants of (I) comprising amino acid additions, deletions and/or substitutions. Included in the invention is DNA encoding all or part of (I); expression vectors containing the DNA, host cells transformed by the vectors; a method for the preparation of the polypeptide by outlure of the transformants or by expression in the milk of a transgenic mammal, and antibodies recognising (I). The Beta-1,3 galactose transferase protein transfers galactose by beta-1,3 bonding to N-accetylglucosamine present in a non-cyclic carbohydrate chain (such as GloNAcbetal-3Galbetal-4Glc) to give Galbetal-3GlcNAc. The protein and DNA encoding it are useful for the treatment and diagnosis of cancer of the digestive system. The present sequence represents a Beta-Gal-T5 exon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Beta-1,3 galactose transferase and DNA encoding it, useful for synthesis of type 1 sialyl Lewis, a carbohydrate for treatment of digestive system

Sequences AASS6729-AASS6968 represent DNA encoding BRCA-1 regulators, ribozyme target recognition RNA sequences, DNA fragments encoding the RNA and primers used in the methods of the invention. Hybridisation of ribozymes to their targets results in cleavage of the RNA target. The ribozymes can be used to cleave regulators of the tumour suppressor BRCA-1, resulting in upregulation or downregulation of BRCA-1 in a cell. The mRNA targets include those encoding the BRCA-1 regulator BRI, inhibitor dominant negative 4 (1D4), breast basic conserved protein 1 (BBCI), CHLR2, AF6, BR2 and BR3. Regulation of BRCA-1 is useful for treating and diagnosing cancer and other proliferative disorders. The severity of an incidence of cancer can be lessened by regulating tumour proliferation through modulation of BRCA-1 expression. The sequences of the invention are useful in the development of anti-cancer drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia;

The invention relates to a nucleic acid molecule which down regulates cypression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGOD). The regulates expression of a neurite growth inhibitor gene (NGOD). The content of a nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic and north motif), a d-cleaver (cleaving RNA with a NRN motif) processessing an NCH motif) a d-cleaver (cleaving RNA with a NRN motif) in the Dressence of a divalent cation that is preferably MG <sup>2</sup> +. C C CD20 in the presence of a divalent cation that is preferably MG <sup>2</sup> +. C C CD20 in the presence of a divalent cation that is preferably MG <sup>2</sup> +. C C C CD20. The treatment may further comprise the use of one or more content of CD20. The treatment may further comprise the use of one or more content of CD20. The treatment may further comprise the use of one or more content of CD20. The treatment may further comprise the use of one or more content of CD20. The treatment may further comprise the use of one or more leukachia's HJW (human immunodeficiency virus) associated WHL, mantle-cell lymphoma, leukachia, B-cell lymphoma, low-grade or follicular non-leukachia, multiple catid may be contacted with a cell to reduce MOGO gene in the presence of a divalent cation that is preferably MG <sup>2</sup> +. Furthermore, the presence of a divalent cation that is preferably MG <sup>2</sup> +. Furthermore is neutrical may be used to contacted with a cell to reduce MOGO gene in the NOGO. The treatment may further comprise the use of one or more content central nervous system (NGN) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral acident disease dementia, multiple of the present contacted with a cell to reduce MOGO expression. The present contactor of disease, muscular dystrophy and/or other neurodegenerative disease human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; escebtoryastular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease. Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and sequence is an amberzyme molecule of the invention Chowrira BM; Claim 88; Page 131; 200pp; English. central nervous system injury. 11-FEB-2000; 2000US-0181797P. 28-FEB-2000; 2000US-0185516P. 06-MAR-2000; 2000US-0187128P. 09-FEB-2001; 2001WO-US004273 RIBOZYME PHARM INC Mcswiggen J, MCSWIGGEN J.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents the preferred target sequence for an enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence at the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave hyperproliferation in restenosis, especially after coronary angioplasty, and in cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb,

                                                                Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; twok; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor; foetal liver kinase 1; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a formation associated with the level of the fms-like tyrosine kinase 1 (ILL-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX7575 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          VEGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vascular endothelial growth factor receptor; VEGF receptor; flt-1; fll

The present invention describes an enzymatic nucleic acid molecule (I) with RNA cleaving activity, which modulates the expression of a plant gene. Also described is a gene comprising a cDNA sequence encoding maize Delta-9 descrurase. (I) can be used to modulate expression of a gene, preferably Delta-9 desaturase or a granule bound starch synthase (GBSS) gene, in a plant (preferably a maize or canola plant). (I) can be used to modulate caffeine synthesis in a coffee plant, incorine production in a tobacco plant, fruit ripening processes in an apple, tomato, pear, plum or peach plant, flower pigmentation in a rose, petunia, chrysanthemum or marigold plant or lignin production in a tobacco, aspen, poplar or pine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; epidermal growth factor receptor; EGFR; EGP-R; target sequence; hammerhead ribozyme; hairpin ribozyme; inhibition; cell proliferation; cancer; genetic drift; detection; mutation; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                       Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Maize; corn; Zea mays; delta-9 desaturase; GBSS; target; substrate; granule bound starch synthase; hammerhead ribozyme; hairpin ribozyme; modulation; gene expression; transgenic plant; cleavage; canola plant; caffeine synthesis; coffee plant; nicotine production; tobacco; fruit ripening; flower pigmentation; lignin production; ss.

The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV96043 and AAV98049 to AAV99090 to Pepresent specifically claimed target sequence from human EGF-R. AAV98044 hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell

encoding Toso, a protein having inhibitory effects on TNF mediated

Example 4; Page 43; 70pp; English.

The present invention describes a Toso protein (I). (I) has antiapoptotic and cytostatic activity. Toso (named after a Japanese liquor
that is drunk on New Year's Day to celebrate long life and eternal youth)
most likely acts by induction of cFLIP expression which inhibits caspase8 processing. Recombinant (I) can be used to modulate apoptosis in a cell
9 processing. Recombinant (I) can be used to modulate apoptosis in a cell
10 conditions can also be treated by administration of the Toso protein or
antibody. Apoptosis related or mediated conditions that can be treated
antibody. Apoptosis related or mediated conditions that can be treated
connective tissue disorder, autoimmune diseases, diseases where T cells
actively destroy cells, including transplant rejection and conditions
where cells of any kind that are not dying express Toso appropriately,

```

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNY) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNY, and AAA17168 to AAA17562 and AAA17684 represent their corresponding target sequences; AAA17685 to AAA1885 and AAA19087 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; AAA19223 to AAA21501 to AAA21595 represent ribozyme sequences for integrin alpha 6 subunit, and AAA21362 to AAA21500 and Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors. AAA21596 to AAA21688 represent their corresponding target sequences;
AAA11689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence
for integrin subunit beta 3, and AAA22476 to AAA23262, AAA23343 to
AAA3422 represent their corresponding target sequences. The ribozymes of
the invention are used for modulating the synthesis, expression and/or
stability of an mRNA encoding angiogenic factor, especially ARNT, Claim 54; Page 263; 305pp; English.

AAA21689 to AAA22475 and AAA23263 to AAA23342 represent ribozyme sequence for integrin subunit beta 3, and AAA22476 to AAA233262, AAA23342 to AAA23442 represent their corresponding target sequences. The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit beta-3, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related mecular degeneration (ARND), inflammation, and arthritis, as well as necowascular glaucoma, myopic degeneration, psoriasis, vertuca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weberson, and arthritis of the stains.

Screening agents useful for modulating apoptosis and controlling apoptosis related diseases. Example 4; Page 53; 75pp; English. WPI; 1999-591379/50.

The present invention describes enzymatic nucleic acid molecules with RNA cleaving activity, which specifically cleave RNA encoded by an aryl hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to AAA17167 and AAA1761 to AAA1762 represent ribozyme sequences for ARNT, and AAA17168 to AAA1762 represent ribozyme sequences for AAA1763 to AAA1886 and AAA1988 to AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to AAA19155 to AAA19222 represent their corresponding target sequences for Tie-2, and AAA1938 to AAA19086 and AAA19155 to AAA19222 represent their corresponding target sequences; sand AAA19231 to AAA20361 and AAA1925 represent ribozyme sequences for Tie-2, and AAA19360 and AAA1925 to AAA19280 and AAA1925 to AAA19280 and AAA19250 to AAA20361 and AAA21590 to AAA21590 and AAA21596 to AAA21598 represent their corresponding target sequences;

Novel ribozymes for modulating the synthesis, expression and/or stability

of an mRNA encoding an angiogenic factors Claim 54; Page 264; 305pp; English.

The present invention describes a method of Screening for a bioactive agent capable of binding a Toso protein. Also described a methods for: (1) screening a bioactive agent capable of modulating activity of a Toso cell-surface receptor, comprising adming a candidate bioactive agent to a cell comprising a recombinant Toso nucleic acid, and exposing the cells to an apoptotic agent that will induce apoptosis; (2) modulating apoptosis comprising administering an exogenous compound that binds Toso, to a cell; (3) identifying a cell containing a mutant Toso gene, comprising determining it's sequence; (4) identifying the Toso genotype, comprising determining the sequence of at least one Toso gene, and (5) diagnosing an apoptosis related condition, comprising measuring activity of Toso in a tissue, and comparing to the activity from non-affected individual's tissue, where a reduced activity of the patient indicates Human, Toso protein; target, drug screening; diagnosis; apoptosis; apoptosis; apoptosis related disease; PCR primer; ss.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; anotropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; lymphoma; leukaemia; human immundeficiency virus; HIV associated MHL; lymphocytic leukaemia; human immundeficiency virus; HIV associated MHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TRP. Orphan receptor, EAR3/COUP-TF-1, the GANA transcription factor gene, IRR-2 and/or the CANT Displacement Protein (DP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of
                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

and Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, central nervous system injury.

Claim 88; Page 78; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule of possessing an NCH mocif), a G-cleaver (cleaving RNA with a NCH worlf). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+. The CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+. The CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+. The creatment may further comprise the use of one or more the read in a particular, the CD20 targetting nucleic acid may be used to treat lymphoma length, bulky low-grade or follicular noncervapies. In particular, bulky low-grade or follicular noncervapies. In particular, bulky low-grade or follicular noncervapies. In municotroma (RNC), small B-cell lymphocytic lymphocytic lymphoma (MCL), immunocytoma (RNC), small B-cell lymphocytic lymphoma, companies the use of the NGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the nucleic acid may be contacted with a cell to reduce NGO activity of the cell and treatment may further comprise the use of one or more theraphes. In particular, the NGO-targetting nucleic acid may be used to theraphes. In particular, the NGO-targetting nucleic acid may be used to theraphes. In particular, the NGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebroxacular acident (CNS, stroke), Alzheimer's disease, demential, multiple solerosis (ALS), chease miscular may further compathy, any or other percentables of the second contacted with the leaves of disease, energy and a maxia, demential multin muscular dystrophy, and/or other neurodegenerative disease nich respond to the modulation of NOGO expression. The present sequence is an inozyme of the invention states which respond to the

and constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense central nervous system injury.

Claim 88; Page 137; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a possessing an NCH motif), a G-cleaver (cleaving RNB with a NYBN motif) prosessing an NCH motif), a G-cleaver (cleaving RNB with a YGY motif). The CD20-targetting nucleic acid is used to cleaver RNB, with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNB, with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNB, with a YGY motif) and be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-therapies. HIM (Numan immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma,

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a numberzyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NKT motif) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NGM with a NGM molecule of CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular non-flockin's lymphoma (MEL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cleukaemia, HIV (human immunodeficiency virus) associated NHI, mantle-cell lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCL), immunocytoma (IMC), small B-cell lymphocytic lymphoma, cation that is preferably MG<sup>2</sup>2 +. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup>2 +. Furthermore, the condition associated with the level of the cell and treat a patient having a condition associated with the level of the cell and treat a patient having a condition associated with the level of theraphes. In particular, the NGG-targetting nucleic acid may be used to treat central nervous system (CNG) injury and cereborovascular accident treat a patient having a condition associated with the level of theraphes. In particular, Hurington's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropably injured neuropably and/or other neurodegenerative disease ataxia, growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury. sequence is an amberzyme molecule of the invention Claim 88; Page 137; 200pp; English.

and

Chowrira BM;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neutite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving a an RNA molecule CD possessing an NCH mocifi), a G-cleaver (Cleaving RNA with an NGW triplet), a zinzyme (cleaving RNA cort CD20-targetting nucleic acid is used to cleave RNA cort CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup>+.

The cell and treat a patient having a condition associated with the level cort CD20. The treatment may further comprise the use of one or more cort cort of CD20. The treatment may further comprise the use of one or more cort cort of CD20. The treatment may further comprise the use of one or more cort cort of CD20. The treatment may further comprise the use of one or more cort cort of CD20. The treatment may further comprise the use of one or more cort cort of CD20. The treatment is B-cell lymphoma, low-grade or follicular non-cort reat lymphoma (MCL), immunodeficiency virus) associated MHL, mantle-cell leukaemia, HIV (human immunodeficiency virus) associated MHL, mantle-cell cort a cid is used to cleave RNA of the NOGO gene in the presence of a divalent cation that is preferably MG<sup>2</sup>+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the coll and treatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to therapies. In particular, the NOGO-targetting nucleic acid may be used to therapies.

regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or or nucleic acids) an inozyme (an endolytic nucleic acid is an NNA motif) proposessing an NCH motif), a G-cleaving RNA with a NYN motif) proposessing an NCH motif), a G-cleaving RNA with a NYN motif) a G-cleaving RNA with a NGN triplet), a zinzyme (cleaving RNA with a XGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably MG^2A+.

CC FUZO. The treatment may further comprise the use of one or more conference in particular, the CD20 targetting nucleic acid may be used to the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more conference in particular, bulky low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular non-Hodgkin's lymphoma (MCD), immunocytoma (IMC), small B-cell lymphocytic lymphoma, induced acid as used to dleave RNA of the NOGO gene in the nucleic acid may be contacted with a cell to reduce NOGO activity of the NOGO. The treatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more colland treat a patient having a condition associated with the level of themotherapy-induced neuropathy, amy/or other neuropathic lateral society and yetcophic lateral
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AAH80076
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                   The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down cregulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a consensing an NCH motif), a cleaving a na RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YOY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YOY motif). The CD20-targetting nucleic acid is used to cleave RNA coff CD20 in the presence of a divalent cation that is preferably Mg^2^+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the reatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, lextaemia, B-cell lymphoma, low-grade or follicular non-Hodgkin's lymphoma (NHL), bulky low-grade or follicular NHL, lymphocytic lextaemia, B-cell lymphocytic lymphoma, manunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, immunocytoma (IMC), small B-cell lymphocytic lymphoma, cargetting nucleic acid may be contacted with a cell to reduce NOGO gene in the presence of a divalent cation that is preferably Mg^2^+. Furthermore, the concent a patient having a condition associated with the level of thararies of the argetting mucleic acid may but comprise the use of one or more correction and further comprise the use of one or more correction and further comprise the use of one or more correction and further comprise the use of one or more correction and particular the NOGO-proposed acid and particular nucleic acid may but the NOGO-proposed acid and particular nucleic acid may further comprise the use of one or more corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CVA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, ataxia, Huntington's disease, Creutifeldt-Jakob disease, muscular dystrophy, and/or other neurodegenerative disease states which respond to the modulation of NOGO expression. The present

The present sequence is a probe used in a method for monitoring anti-
hepatitis B virus (HBV) drug resistance in a patient by genetic detection
of any one of mutations L528M, M552V/I and/or V/L/M555I in HBV DNA,
polymerase in a biological sample from the patient. The method is useful
in the field of genetic detection of anti-HBV drug resistance during HBV
therapy. The method is rapid, reliable and precise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monitoring anti-HBV drug resistance by genetic detection of mutations in DNA polymerase of HBV in patient's sample, involves hybridizing the polynucleic acids of the sample with a probe and detecting the hybrid.
HBV; hepatitis B virus; DNA polymerase gene; anti-HBV drug resistance; mutation detection; probe; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid hybridisation, probe, primer, human, rabbit, HIV-1, disease diagnosis, ss.

an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                 The present invention describes a method for predicting the potential of an oligonucleotide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonucleotides within the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           present invention describes a method for predicting the potential of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method for predicting the potential of an oligonouclectide to hybridise to a (complementary) target nucleotide sequence, involving identifying a subset of oligonoucleotides within the predetermined number of unique oligonoucleotides based on the evaluation of the parameter. Oligonoucleotides in the subset are identified that are clustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of

```
The present invention describes a method for predicting the potential of sequence, involving identifying a subset of oligonucleotides unthin the predetermined number of unique oligonucleotides based on the evaluation of the parameter. Oligonucleotides in the subset are identified that are lustered along a region of the nucleotide sequence that is hybridisable to the target nucleotide sequence. This is useful for evaluating oligonucleotide probe sequences. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                     Predicting the potential of an oligonucleotide to hybridize to a target nucleotide sequence, useful for evaluating oligonucleotide probe sequences, by identifying a oligonucleotides based on the evaluation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Human GDMLP-1 17-mer scanning SEQ ID NO:5 sequence SEQ ID NO:8358.

```
The present invention describes a human genome-derived myosin-like protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1 can be used as probes to detect, characterise and quantify nucleic acids can be used as probes to detect, characterise and quantify protein the language of hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins as standards in assays used to determine the concentration and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The polymucleotide sequence encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide, for raising antibodies that recognize hGDMLP-1 proteins, or as specific biomolecule capture probes for surface-enhanced laser desorption ionization, comprises human myosin-like protein hGDMLP-1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

Hanzel DK,

The present invention describes a human genome-derived myosin-like protein 1 (hGDWLP-1). The protein and polynuclectide sequences of hGDWLP-1 can be used in gene therapy and vaccine production. The hGDWLP-1 mucleic acids can be used as probes to detect, characterise and quantify hGDWLP-1 mucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDWLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDWLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDWLP-1 proteins, as specific biomolecule and/or amount specifically of hGDWLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDWLP-1 production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The production and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDWLP-1 may be used for diagnosing a disorder associated with the expression of hGDWLP-1, in particular heart and skeletal muscle disorders. hoDWLP-1 is localised to chromosome 22. The present sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed sequence in the exemplification of the present invention. The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP
complete acids in gene therapy and vaccine production. The hGDMLP-1

mucleic acids can be used as probes to detect, characterises and quantify

mucleic acids can be used as probes to detect, characterises and quantify

complete initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

computed simmunogens to raise antibodies that specifically recognise hGDMLP
1 proteins, as standards in assays used to determine the concentration

and/or amount specifically of hGDMLP proteins, as specific biomolecule

computer probes for surface-enhanced laser desorption indisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

computed sequences encoding hGDMLP-1 may be used for diagnosing a

clisorder associated with the expression of hGDMLP-1, in particular heart

and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22.

The present sequence represents an oligomer used in the screening of the

and/or amount specifically of hGDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser descritic deficiency in hGDMLP-1 production, and in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polymucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence data for this patent did not for my particulon. N.B. specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequence

The present invention describes a human genome-derived myosin-like

protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-1

can be used in gene therapy and vaccine production. The hGDMLP-1

mucleic acids can be used as probes to detect, characterise and quantify

hGDMLP-1 nucleic acids in samples, as amplification substrates, to

hGDMLP-1 nucleic acids in samples, as amplification substrates, to

provide initial substrates for the recombinant engineering of hGDMLP-1

protein variants having desired phenotypic improvements, and for

expressing the proteins. The hGDMLP-1 proteins or polypeptides may be

used as immunogens to raise antibodies that specifically recognise hGDMLP-1

capture probes for surface-enhanced laser description ionisation, as

capture probes for surface-enhanced laser description ionisation, as

therapeutic supplement in patients having specific deficiency in hGDMLP-1

capture spooses for surface-enhanced having specific deficiency in hGDMLP-1

Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL. 

Example 2; Page 228; 718pp; English.

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shared an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male germ cell development, and the HTPL gene was impost to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of thuman control of the diagnosing of the decreased expression or activity of human mann and activity of the property and structure of the decreased expression or activity of human mann and activity of the property and protein and protein and protein and activity of human mann and activity of the protein and protein and protein and protein and activity of the protein and protei HTPL. Such disorders include disorders of testis, or adrenal, adult and foetal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligomucleotide was used in an example from the invention

The present invention relates to human testis expressed Patched like protein (HTPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (I for long). HTPL shares an overall structure organisation with the Patched protein. The shares an overall structure strongly imply that HTPL plays a role similar to that of Patched, and is a potential tumour suppressor. HTPL is important in regulating male garm cell development, and the HTPL gene was mapped to human chromcsome 10pl.2. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therappend amunifacture of a medicament for treatment or prevention of such disorder associated with decreased expression or activity of human HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. Novel isolated human testis expressed Patched like protein (HTPL), useful for identifying agonist and antagonist and specific binding partners, and for treating subjects having defects in HTPL.

Example 2; Page 228; 718pp; English

The present invention relates to human testis expressed Patched like protein (HPPL, see ABV78759 to ABV78762 and ABB98519 to ABB98520). HTPL has two isoforms, with a few single base pair differences between the two. One of the single base pair changes introduces a premature stop codon in HTPL-S (S for short) compared to HTPL-L (L for long). HTPL shares an overall structure organisation with the Patched protein. The shared structural features strongly imply that HTPL plays a role similar important in regulating male germ cell development, and the HTPL gene was mapped to human chromosome 10p12.1. HTPL and its coding sequence are useful for diagnosing a disorder caused by mutation in HTPL, and in therapy and manufacture of a medicament for treatment or prevention of therapy and manufacture of a medicament for treatment or prevention of HTPL. HTPL with disorder associated with decreased expression or activity of human HTPL. HTPL. Such disorders include disorders of testis, or adrenal, adult and foctal liver, bone marrow, brain, kidney, lung, placenta, prostate, skeletal muscle or colon function. HTPL proteins and nucleic acids are clinically useful diagnostic markers and potenial therapeutic agents for male infertility and cancer. The present oligonucleotide was used in an male infertility and cancer. example from the invention

Novel polynucleotide which down regulates expression of Ets-related gen useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.

Claim 4; Page 74; 149pp; English.

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sarcoma, melanoma, tumour angiogenesis, diabetic retinopathy, manular degeneration, theorems angiogenesis, diabetic retinopathy, manular degeneration, cumour angiogenesis, diabetic retinopathy, manular degeneration, verruca vulgaris, angiofibroma of tuberous sclerosis, port-wine stains, Sturge Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber rendu Syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour andiopenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting (I) with RNA, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and cargeting cargeting penes that share homology with regulate expression of ERG, and enzymatic nucleic acids molecules which regulate expression of ERG, and related PCR primers of the invention

```
The invention relates to a mucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's marcoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, verruca tumour angiogenesis, diabetic retinopathy, macular degeneration, verruca vulgaris, angiofibroma of tubercus sclerosis, port-wine stains, Sturge (Weber syndrome, Rippel-Trenaunay-Weber syndrome, Osler-Weber-rendu for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies cuder conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of tother therapies such as radiation or conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for classic call or to detect the presence of ERG RNA in a cell. (I) is useful for specifically transence of ERG RNA in a cell. (I) is useful for specifically transence of ERG RNA in a cell. (I) is useful for specifically transers that share homology with ERG gene or ERG fusion genes.

ABK/1354-ABK/2719 represent mucleic acids, including antisense and enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules which regulate expression of ERG, and enzymatic nucleic acid molecules acids, including antisense and enzymatic nucleic acid molecules which regulates expression of ERG, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; hammerhead ribozyme; cytostatic; antitumour; antidiabetic; ophthalmological; antiarthriti; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ewing's sarcoma; melanoma; psorias; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing;
                                                                                                                                                                                                                                                                                                                                         Novel polynucleotide which down regulates expression of Ets-related genuseful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human ERG hammerhead ribozyme target sequence, Seq ID No 1012.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0.6%; Score 12.4; DB 1; Length 17; 15.7%; Pred. The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's sacroma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, unclaimed a tumour angiogenesis, diabetic retinopathy, macular degeneration, variants, suggiogenesis, angiofibroma of tuberrous sclerosis, port-wine stains, Sturge (Weber Syndrome, Poler-Weber-rendu (Weber Syndrome, Poler-Meber-rendu (Weber Syndrome, Poler-Weber-rendu (Weber Syndrome, Poler-Weber-rendu (ERG) (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in a conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG (Sene or ERG RNA in a cell). (I) is useful for specifically cation such as May2+. (I) is useful for diagnosis of conditions and chiesence of ERG RNA in a cell. (I) is useful for specifically cated to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect CG the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acids, including antisense and cargamination of the cargamination of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer. dishering retinants.

Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome. WPI; 2002-082995/11.

Claim 4; Page 92; 149pp; English.

Randi AM;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for treating conditions selected from cancer, lymphoma, Ewing's saccoma, melanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, necvascular glaucoma, myopic degeneration, arthritis, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, port-whose stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. The method comprises the use of one or more therapies the treatment. The method comprises the use of one or more therapies under conditions suitable for the treatment. Leukaemia or tumour angiogenesis is treated by administering (I) to the patient in conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting the cell with (I). (I) is useful for cleaving RNA of ERG gene, by contacting the cell with (I). (I) is useful for cleaving conficuent as Mg2+. (I) is useful for genecic to carions such as Mg2+. (I) is useful for specifically the presence of ERG RNA in a cell. (I) is useful for specifically transcring genes that share homology with ERG gene or ERG fusion genes. ABK/1354-ABK/2319 represent nucleic acids, including antisense and cervariation contaction deleter which regulate expression of ERG, and

```

The present sequence is a forward primer for the SPO11 gene, which is involved in the formation of double-strand breaks during recombination.

It is used with the reverse primer given in ABZ81921. The primers correspond to a position of the Arabidopsis thaliana SPO11-1 genomic DNA which encodes a stretch of amino acids which is highly conserved between known SPO11 orthologues of different species. They were used to amplify SPO11 orthologues of different species. They were used to amplify SPO11 orthologues of different species. They were used to amplify SPO11 orthologues of different species. They were used to amplify SPO11 orthologues organisms (plants, fungi or animals) from a starting organisms. This involves producing haploid cells from the heterozygous starting organism and creating homozygous organisms. Cfrom the haploid cells. Recombination is prevented or suppressed during from the haploid cells. Recombination is prevented or suppressed during organism and creating homozygous organisms. That arises in every constructed or suppressed by interfering with one or more target genes or prevented or suppressed by interfering with one or more target genes. Involved in recombination, such as the SPO11 gene. This is achieved using antisense RNA, RNA interference (RNA1) molecules, virus induced gene creates in particular to plant breading to produce parental lines for the production of hybrid offspring, and its use for the transfer of claimed. The present primer pair can be used to select SPO11 genes for contained to the production of F1 hybrid seed is use in the method

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence, a sequence that of alignment, at least 80 % identity to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic configuration of the invention are useful as probes and primers for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell diseases that are characterised by development of tumours or cell captent samples is useful for disagnosis and/or prognosis of these containing the polypeptides can also be used to generate antibodies, and characterial as components of proper containing the containing the containing the containing the polypeptides and antibodies are useful as components of protein containing the containing the containing the polypeptides are useful as components of protein containing the containing
                                                                                                                                                                                                                                                                                      New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        fukutin oligonucleotide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 17 BP; 1 A; 2 C; 4 G; 10 T; 0 U; 0 Other;

New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.

Disclosure; Page 679; 720pp; French.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence with, after optimal alignment, at least 80 % identity to the 17 mer sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic acids of the invention are useful as probes and primars for detecting, identifying quantifying and/or amplifying a nucleic acid, e.g. as one proportion of recombinant polypeptides. Any of the nucleic acids, production of recombinant polypeptides. Any of the nucleic acids, polypeptides, vectors containing the nucleic acids, cells containing the vector or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and articles and in the expression of the 17 mer nucleic acids in antibodies directed against the plane of the proposed or cell degeneration, specifically cancer but also Alzheimer's disease and articles and and antibodies directed acids the 17 mer nucleic acids in antibodies. patient samples is useful for diagnosis and/or prognosis of these diseases. The polypeptides can also be used to generate antibodies, and both the polypeptide and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression therapy. This polynucleotide sequence represents a tume related human fukutin oligonucleotide of the invention

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful f treating cancer, inflammatory disorders and autoimmune diseases.

Clahm 3; Page 36; 72pp; English.

regulates expression of a sequence encoding a subunit of nuclear factor kappa B (NFRB), where (I) is an inoxyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG-2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, cold molecules are also useful for treating inflammatory disease such as chemotherapy applications, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury context in methors of context in particular proposation injury contexts in the contral nervous system (MS) and myocardial) glometral nervous systems. The invention describes an enzymatic nucleic acid molecule (I) which down (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

Necrosis factor kappa B (NFKB) sub-unit modulating DNAzyme #90.

ACA08321 standard; DNA; 17 BP.

RESULT 546 ACA08321, 03-JUN-2003 (first entry)

ACA08321;

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases. Claim 3; Page 41; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor configuration. Where (I) is an inozyme, zhizyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat treating a patient having a condition associated with the level of REL-A treating a patient having a condition associated with the level of REL-A the presence of a divalent cation, especially MG^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breat; lung, prostate, colorectal, brain, oscophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of coher drug. therapies such as monocolonal antibodies, RELA-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gencitable or radiation therapy. The enzymatic and antisense mucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 48; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor stappa B (NFKB), where (1) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. schultz451-1.rng

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 55; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B (WFRA), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA condition associated with the level of REL-A. (I) is useful for cleaving RNA condition, especially MG^2++ The enzymatic and the presence of a divalent cation, especially MG^2++ The enzymatic and anticase nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, ossophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidrug resistant cancer. The method involves use of other drug therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemocherapy including paclitaxel, docetaxel, cisplatin, methotrexate, gencitables are also useful for treating inflammatory disease such as an encorons of a contract or describing and antisense nucleic acid also useful for treating inflammatory disease such as the interapy. rheumatoid arthritis, restenosis, asthma, Črohn's disease, diabetes, obesity, autoimmune disease, lupus, multiple sclerosis, transplant/graft rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or This sequence represents the substrate of a novel enzymatic nucleic acid molecule infection.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor regulates expression of a sequence encoding a subunit of nuclear factor regulates B(NREM), where (I) is an inozyme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially Mg^2+. The enzymatic and antisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal; stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or multidung resistant cancer. The method involves use of other drug charapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including paclitaxel, docetaxel, cisplatin, methotrexate, cyclophosphamach, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. Alutorouracil carboplatin, adatrexate, gemcitabine or radiation therapy. Interating inflammatory disease such as relemanted arkhritis, restenosis, asthma, Crobin's disease such as cidencial nervous system (CNS) and myocardial), glomerulonephritis, cefection, gene therapy applications, inclammatory bowel disease or central nervous system (CNS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents an enzymatic nucleic acid used to modulate the function of a necrosis factor kappa B sub-unit
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .;

acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (H1V) or a component of H1V. The nucleic acid molecule of the invention has cytostatic, anti-H1V, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and H1V activity in a cell. The nucleic acids are also useful for reacting breact, ovarian, colorectal, lung prostate, bladder, or pancreatic cancer, and H1V infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ65531, ABZ65520, ABZ66585 represent substrate/target sequences for the human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               invention relates to a novel short interfering RNA (siRNA) nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; ribozyme; short interfering RNA; siRNA; HER2; K-Ras; enzymatic nucleic acid; H-Ras; N-Ras; HIV; cytostatic; anti-HIV; anti-rheumatic; cancer; AIDS; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              à
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-theumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ65216, ABZ65531, ABZ65531, ABZ66520 - ABZ65524,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ABZ66530 - ABZ66585 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human, ribozyme; short interfering RNA; siRNA; HER2; K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic rheumatic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for reducing also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ65531, ABZ65520 - ABZ6524, ABZ65530 - ABZ65524,
                                                                                                                                            Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding HER2, K-Ras, H-Ras, N-Ras, and human deficiency virus sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel short interfering RNA and enzymatic nucleic acid useful for treating cancer, modulates the expression of a nucleic acid encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human, ribozyme, short interfering RNA, siRNA; HER2, K-Ras;

The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-HER2, K-Ras H-Ras, and HIV activity in a cell. The nucleic acid size activity in a cell. The nucleic acids are last in the nucleic acid molecules are useful for reducing also useful for treating breast, ovaxian, colorectal, lung, prostate, shown in ABESSBBS - ABZ65216, ABZ65531, ABZ65520 - ABZ65524, ABZ65530 - ABZ65535 - ABZ65524, ribozymes of the invention

Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, anderzymes, also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amberzyme; G-cleaver ribozyme; decoy molecule; aptamer;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and enzymes, ambezzymes, and expression by a pramers that bind to HBV reverse inozymes, inozymes, ambezzymes, and standard ribozymes. Also disclosed transcriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and/or potential are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular expression such as cirrhosis, liver failure, and hepatocellular expression and man strand DNAzyme sequences disclosed in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ·.
                                                           treating cirrhosis, liver failure, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        RNA stability, RNA expression, RNA synthesis, antisense, enzymatic nucleic acid, hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-claever ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; substrate; ss.

(RIBO-) RIBOZYME PHARM INC.

```
The present invention relates to nucleic acid molecules which modulate the synthesis expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. Also disclosed in nozymes, zinzymes, amberzymes, and G-cleaver ribozymes. BNAzymes, as well care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV or genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene methods of the invention are useful for the treatment of degenerative and tisease states related to HBV and HCV infection, replication and gene expression and as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV viral inozyme, inozyme, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                  Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis, antisense, enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 amberzyme, G-oleaver ribozyme, decoy molecule, aptamer, inozyme; zinzyme amberzyme, G-oleaver ribozyme, decoy molecule, aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide, antiinflammatory; substrate; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               d
                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) RNA. The nucleic acid molecules include antisense and enzymes, amberzymes, and enzymes, DNAzymes, and enzymes, allocymes, and preverse transcriptase primer sequences, as well care nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular carcinoma. The present sequence represents a substrate for one of the HBV cirbozyme, d-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ·

The present invention relates to nucleic acid molecules which modulate the grathers, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBW) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as harmerhead ribozymes, DNAzymes, incymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBW reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBW compounds and/or HBW reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBW compounds and/or potential therapies directed against HBW, and compounds compounds and/or potential therapies directed against HBW, and compounds compounds and/or potential therapies directed against HBW, and compounds methods of the invention are useful for the treatment of degenerative and disease states related to HBW and HWY infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBW ribozyme, inozyme, disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular cardinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes. DNazymes, and enzymatic nucleic acids such G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as dirrhoeis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus infection. ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistence. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying, quantifying and/or amplifying nucleic acid, e.g. as one component of a gene other, in vitro as (anti) sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells. The present invention relates to murine oligonucleotides (ACC62754-ACC68806), which are associated with tumour suppression, tumour reversion, apoptosis and virus resistance. The oligonucleotides are useful as (1) as probes and primers for detecting, identifying quantifying and/or amplifying nucleic acid, e.g. as one component of gene chip; in vitro as (anti)sense reagents, and (2) for production of recombinant polypeptides. The oligonucleotides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia Sequence 17 BP; 1 A; 3 C; 3 G; 10 T; 0 U; 0 Other;

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, dentifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, expression of the nucleotides and polypeptides can be used in the nucleotide of the nucleotides and polypeptides can be used to the nucleotide as associated with abnormal
                                                                                                                                                                                                                                                                                                                     New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides re nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Suppression or reversion, applyois and or viral resistance, to produce excombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors concaining them and cells containing the vectors), the encoded polypeptides and antibodies of viral infections or diseases characterized by development of tumours or cell degeneration of seases characterized by development of tumours or cell degeneration (e.g. Albeimer's disease or schizophrenia). Analysis of these expression of the nucleotides can be used for diagnosis also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                                                                                                                                                                                          New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 12.4; DB 1; Length 17;

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides. The nucleotides are used as probes or primers for detecting, dentifying admitfying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as reperimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (bb) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis also he wend for prognation and or the nucleotides and polypeptides can also he used for diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; antiviral; neuroprotective; nootropic; neuroleptic; ss;

0; The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80¢ identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the indentifies. The nucleotides are uplifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour sense and antisense sequences, of nucleotides involved in tumour recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and cells containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia). Analysis of the expression of the mucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related Gaps ; 0 Score 12.4; DB 1; Length 17; Pred. Σ

WPI; 2003-441574/41.

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

```
The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides. The nucleotides are used as probes or primers for detecting, clentifying quantifying and/or amplifying nucleic acids, as in vitro sense and antisens sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and colls containing the vectors), the encoded polypeptides and antibodies (by against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Analysis of the expression of the nucleotides can be used for diagnosis and/or prognosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, correction of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, correction of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, correction of the nucleotides and polypeptides can be used to screen for their specific interactive molecules, correction of the nucleotides and polypeptides can be used to screen for their specific interactive molecules.

New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as a passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human

Example 2; SEQ ID NO 314; 468pp; English.

The invention relates to a nucleic acid molecule which encodes a Na+/H+

exchanger like protein (NHELP1). The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing a medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514). 8866666666666888

The NHELP1 nucleic acid molecule, NHELP1 polypeptide, an antibody against the protein or its antigen-binding fragment is useful in therapy. The NHELP1 nucleic acid molecule, NHELP1 polypeptide and an agonist are particularly useful for manufacturing medicament for treating or preventing a disorder associated with decreased expression or activity of human NHELP1. The antibody or its antigen-binding fragment, and an antagonist, are useful for manufacturing a medicament for treating or preventing a disorder associated with increased expression or activity of human NHELP1. The NHELP1 nucleic acid or protein is useful as passive replacement therapy, as a vaccine, or in diagnostic methods. This sequence corresponds to a 17-mer oligonucleotide spanning the sequence of the human NHELP1 gene (ADC03514).
                                                                                                                                                                                                                                                                                                                                                                                                                                                ๙
                                                                                                                                                                                                                                                                                                                                                                                                                                           New human sodium-hydrogen exchanger like protein 1 (NHELP1), useful as passive replacement therapy or as a vaccine for treating or preventing disorders associated with aberrant expression or activity of human NHELP1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

```
fragments of at least 15 consecutive nucleotides of these nucleotides, a fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with the nucleotides, or the complement, or corresponding RNA, of the nucleotides are used as probes or primers for detecting, cannot form and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistence, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides flats vectors containing them and calls containing the vectors), the encoded polypeptides and antibodies (Ab) against the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or call degeneration (e.g. Alzheimer's disease or schizophrenia).

New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related

The invention relates to the isolation of 6327 nucleotide sequences, fragments of at least 15 consecutive nucleotides of these nucleotides, a sequence having at least 80% identity, after optimal alignment, with the nucleotides, or the complement, or corresponding RNA, of the nucleotides, or the complement, or corresponding RNA, of the cumpleotides. The nucleotides are used as probes or primers for detecting, identifying, quantifying and/or amplifying nucleotides as in vitro sense and antisense sequences, of nucleotides involved in tumour correspondinant polypepides, and to prepare transgenic animals, as cecominant polypepides, and to prepare transgenic animals, as cells containing the vectors), the encoded polypeptides and antibodies or viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Co viral infections or diseases characterized by development of tumours or and/or prognesis of the expression of the nucleotides can be used for diagnosis and or prepared to screen for their specific interactive molecules, potentially useful for treating diseases can be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal expression of the nucleotides.

                                                                                                                                                                                                                                                                                                                                                                                                 This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target mucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPs) of the target sequence. This oligonucleotide sequence is a primer oligomer used for the analysis of CpG positions within genomic DNA, used in an exemplification of the
                                                                                                                                                                                                                                                                                Detecting and differentiating cytosine methylation state of genomic DNV useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and PNA-oligomers compared in as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPB) of the target sequence. This coligonactide sequence is the PCR primer 2 used to amplify the RARB colifornian and the methylation status of a specific CpG site, used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR; primer; ss; lung cell proliferative disorder; CpG dinucleotide; adenocarcinoma; squamous cell carcinoma; cytostatic; probe; PNA-oligomer; cytosine methylation state.
                                                                                                                                          Detecting and differentiating cytosine methylation state of genomic DNA, useful for diagnosing, treating prognosticating and/or monitoring lung cell proliferative disorders e.g. adenocarcinoma and squamous cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Primer oligo used for analysing CpG islands in genomic DNA (SegID 899).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

This invention relates to a novel method for detecting and differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated CpG dinucleotides consistent in the target NNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and NNA-oligomers contact are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNRE) of the target sequence. This oligomucleotide sequence is a primer oligomer used for the analysis of contactions within genomic DNA, used in an exemplification of the
cting and differentiating cytosine methylation state of genomic DNA, ul for diagnosing, treating prognosticating and/or monitoring lung proliferative disorders e.g. adenocarcinoma and squamous ceil

Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to hybridize with target.

```
The invention relates to a method of predicting the potential of oligonuclectides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligonuclectide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains ofbemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligonucleotides for each of multiple target

                    The invention relates to a method of predicting the potential of coligonuclectides to hybridise to target nuclectide sequences. The method is useful for predicting the potential of an oligonuclectide to hybridise to a target nuclectide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nuclectides. The method is also useful for complementary target nuclectide sequence. The method is useful to predicting the potential of the oligonuclectides to hybridise to a complementary target nuclectide sequence. The method is useful to predict efficient hybridisation oligonuclectides for each of multiple target sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonuclectides. The present sequence represents a rabbit beta-globin derived oligonculectide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; oligomucleotide hybridisation potential; efficient hybridisation;

oligonucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of an oligonucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligonucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict sequence thybridisation oligonucleotides for each of multiple target sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonucleotides. The present sequence represents a rabbit beta-globin derived oligonucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Predicting potential of oligonucleotides to hybridize to target nucleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to
sequences therefore very large arrays may be constructed and tested with minimum synthesis of oligonucleotides. The present sequence represents a rabbit beta-globin derived oligonculeotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                           ss; oligonucleotide hybridisation potential; efficient hybridisation; large array; minimum oligonucleotide synthesis; rabbit; beta-globin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of predicting the potential of

```

```
The invention relates to a method of predicting the potential of oligomucleotides to hybridise to target nucleotide sequences. The method is useful for predicting the potential of a noligomucleotide to hybridise to a target nucleotide sequence, e.g. RNA or DNA or a sequence that contains chemically modified nucleotides. The method is also useful for predicting the potential of the oligomucleotides to hybridise to a complementary target nucleotide sequence. The method is useful to predict efficient hybridisation oligomucleotides for each of multiple target efficient hybridiscore very large arrays may be constructed and tested with minimum synthesis of oligomucleotides. The present sequence represents a rabbit beta-globin derived oligonculeotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Predicting potential of oligonucleotides to hybridize to target uncleotide sequence comprises determining and evaluating for each oligonucleotide a parameter predictive of the oligonucleotides ability to hybridize with target.
                                                                                                                                                                                                                                    oligonucleotide hybridisation potential; efficient hybridisation; se array; minimum oligonucleotide synthesis; rabbit; beta-globin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

RIBOZYME PHARM INC. BLATT (RIBO-)

(CHOW/) CHOWRIRA B M. MCSWIGGEN J. (BLAT/) (MCSW/)

Chowrira BM; Mcswiggen J, Blatt L,

WPI; 2001-607195/69.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

Claim 88; Page 98; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down concernations are supersion of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a concernation and byte concernation acid cleaving an RNA motifi) proposessing an NCH motif), a G-cleaver (cleaving RNA with a NNA motifi) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably Mg<sup>2,2</sup>+. Cof CD20 in the presence of a divalent cation that is preferably Mg<sup>2,2</sup>+. Cof CD20 in the presence of a divalent cation that is used to cleave RNA cof CD20. The treatment may further comprise the use of one or more cof copy of the repairs. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma (NCI), inmunocytoma (NWI) low-grade or follicular NMI, lymphocytic Hodgen in the copy and inflammatory arthropathy. The NCGO-immune thrombocytopaenia, and inflammatory arthropathy. The NCGO-immune and inflammatory arthropathy and concarded to the nucleic acid may be contacted with a cell to reduce NCGO activity of the nucleic acid may be contacted

The present invention relates to a method (M1) for determining a predisposition for or the occurrence of neurodegenerative disease in a subject. The method comprises detecting in a target nucleic acid obtained from the subject the presence or absence of an allelic variant of one or more polymorphic regions of one or more genes selected from uPA more polymorphic regions of one or more genes selected from uPA degrading enzyme), KNSL1 (Kinesin-like protein 1), LIPA (Lysosomal acid lypase), and TNFRSFF (Thumour Necrosis Factor Receptor-SF6), where the presence of at least one of the allelic variant of one or more presence of at least one of the allelic variant of one or more polymorphic regions is indicative of a predisposition for or the chromosome 10. M1 is useful for determining a predisposition for or the Determining a predisposition for or the occurrence of neurodegenerative disease, e.g. Alzheimer's disease by detecting in a target nucleic acid the presence or absence of an allelic variant of one or more polymorphic regions. New nucleic acid encoding a Thermus scotoductus strain X-1, ATCC Deposit No. 27978 nucleic acid polymerase, useful for producing nucleic acid polymerases having e.g., improved sequence discrimination or better salt

Example 1; Page 79; 179pp; English.

The present invention describes isolated nucleic acids encoding nucleic acid polymerases from Thermus scotoductus. Also described: (1) an isolated nucleic acid (1) encoding a nucleic acid polymerase from Thermus scotoductus strain X-1, ArCC Deposit No. 27978; (2) an isolated DNA polymerase polypeptide from Thermus scotoductus strain X-1, ArCC Deposit No. 27978; (3) an isolated nucleic acid (II) ommeraing any of a set of 12 nucleic acid polymerase; (4) an isolated nucleic acid (III) encoding a nucleic acid polymerase; (4) an isolated nucleic acid (III) encoding a nucleic acid polymerase comprising any of a set of 16 amino acid sequences (22, see ADA50389 to ADA50404); (5) isolated nucleic acid polymerase comprising any of amino acid sequences (22, see ADA50389 to ADA50404); (5) isolated nucleic acid polymerase comprising any of amino acid sequences (7) a host cell comprising an isolated nucleic acid molecule encoding a nucleic acid polymerase from Thermus scotoductus strain X-1, ATCC Deposit No. 27978; (8) a host cell comprising (I) or (III); (9) a kit comprising a nucleic acid polymerase comprising a nucleic acid polymerase comprising a nucleic acid polymerase comprising any of amino acid sequences S2; (10) preparing (MI) a nucleic acid polymerase

comprising any of amino acid sequences S2 by incubating a host cell comprising an encoding nucleic acid under conditions sufficient for RNA transcription and translation; (11) a nucleic acid polymerase prepared by M1; (12) synthesising DNA (M2) comprising contacting a polypeptide comprising any of amino acid sequences S2 with a DNA under conditions sufficient to permit DNA polymerisation; (13) a method (M3) for thermocyclic amplification of nucleic acid; and (14) a method (M4) of primer extension. The nucleic acid; suseful for producing nucleic acid polymerases having improved sequence discrimination, better salt tolerance or varying degrees of thermostability with applications e.g. in PCR and DNA sequencing. The present sequence represents a PCR primer for Thermus scotoductus nucleic acid polymerase, which is used in an example from the present invention.

reverse New nucleic acid, useful for DNA sequencing or amplification, r transcription, RNA amplification or primer extension reactions.

Example 1; Page 50; 64pp; English.

The present invention describes a nucleic acid (I) encoding a nucleic acid polymerase or a derivative nucleic acid polymerase with a mutation that decreases 5.3 exonuclease activity or that reduces discrimination against dideoxymucleotide triphosphates. Also described: (I) a vector comprising the nucleic acid (I); (2) a host cell comprising the nucleic acid polymerase or its derivative; (4) a kit comprising a container containing the nucleic acid polymerase of (3); (6) synthesising a DNA; (7) making the nucleic acid polymerase of (3); (6) synthesising a DNA; (7) thermocyclic amplification of nucleic acid; and (8) primer extending a DNA. The nucleic acid (1) is useful for DNA sequencing or amplification, RNA amplification or primer extension reaction. The present sequence represents a PCR primer for Thermus oshimai nucleic

The 5' thymidine derivative was conjugated with a polyamine, pref. tris (aminobutyl) amine. The resulting oligonuclectide analogue has enhanced cellular uptake and is less susceptible to nuclease activity than standard oligonuclectides. It can be used in anti-sense therapy.     New oligo:nucleotides hybridisable with H-ras or Ki-ras gene nucleic acid - in normal or mutated form, for detecting or modulating gene expression, specifically inhibiting proliferation of cancer cells.
                                                                                                              The sequences given in AAQ62025-38 are antisense phosphorothioate oligonucleotides which are targetted to various regions of Ki-ras ancogene. These oligonuceotides gave significant and reproducible inhibition of the level of Ki-ras mRNA. These oligonucleotides may be used for detecting and modulating, esp. inhibiting, expression of the Ki-ras gene, esp.for inhibiting proliferation of cancer cells, and other conditions associated with Ki-ras oncogene activation. Activated (mutant) Ki-ras can be detected from its differential affinity for particular oligos. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1..17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense; phosphorothioate; H-ras; translation initiation codon; codon-12 point mutation; activated; inhibition; ras-luciferase; activity; detection; modulation; inhibition; expression; oncogene; proliferation; Ki-ras; cancer cell; ss.
                                                                                                                                                                                                                                                                                                                          This is a c-myb mRNA target sequence (nucleotide no. 2695) of an enzymatic RNA molecule (ribozyme) which cleaves mRNA associated with the development or maintenance of a restenotic condition. The conon. of the ribozyme necessary to effect a therapeutic treatment is lower than that of an antisense oligonucleotide and the specificity of action is higher. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                           Enzymatic RNA molecules which cleave mRNA - used to treat or prevent inflammatory, arthritic, stenotic or cardiovascular diseases or conditions.

cytomegalovirus gene selected from DNA polymerase, IE1 and IE2, or hypridisable to the B, E2, E4, E5, E6, E7, L1 or L2 reading frames of a papillomavirus. The PNAs can be used to target RNA and single stranded DNA (ssDNA) to produce antisense-type gene regulation moieties. Hence they may be used therapeutically for modulating cytomegalovirus and papillomavirus processes and also as diagnostics (e.g., as probes for specific mRNAs). PNA oligomers have high affinity for complementary single stranded DNA. They are also able to form triple helices in which first PNA strand binds with RNA or ssDNA and a second PNA strand binds with the resulting double helix or with the first PNA strand binds with the resulting double helix or with the first PNA strand binds character of significant charge and are water soluble, which facilitates cellular uptake. Futher, since they contain amides of non-biological amino acids, they are biostable and resistant to enzymatic degradation by processes. The present sequence targets a portion of the papillomavirus

for diagnosis and New peptide nucleic acid oligomers for ras oncogene modulation including specific inhibition of the activated gene, for diagnor treatment esp. of tumours. Claim 1; Page 133; 148pp; English.

These The sequences given in AAQ79822-57 represent peptide nucleic acids (PNA) that bind to complementary ssDNA and RNA strands through their oligoribonucleotide ligands which are linked to a peptide backbone. Thes sequences are directed to the human H-ras and K-ras genes and they 

```
modulate the expression of the ras gene in cells or tissues and specifically modulate the expression of the activated ras in cells or tissues suspected of harbouring a mutated gene. These sequences are designed to hybridise with the mRNA from the H-ras and K-ras genes which interferers with the normal role of mRNA causing a loss of function in the cell. These sequences are used in the treatment of tumours. (Updated on 25-MAR-2003 to correct PN field.)

Immortalised pre-adipocytes contg viral oncogene fragment - useful for identifying cpds that regulate lipolysis and thermogenesis, as lipolytic agents and models for studying adipocyte processes.

Example 1; Page 15; 52pp; French.

The invention relates to new immortalised cell lines derived from preadipocytes containing an immortalising fragment of a viral oncogene. The
immortalised adipocytes are used to identify substances able to regulate
lipolysis and/or thermogenesis (potential therapeutic agents for treating
diabetes and obesity). The cell lines have the advantage that they can be
maintained in long term culture (contrast primary cultures of adipocytes)
without loss of characteristic markers or ability to differentiate. The
primary limmortalised pre-adipocytes differentiate into mature adipocytes when
placed in a medium containing insulin and examethasone. The primars
AAT43098-19 are used to amplify marker genes to verify differentiation of
the pre-adipocytes into mature adipocytes. Primers AAT43100-1 were used to amplify a 329 bp region of the gene encoding the beta-2 adrenergic receptor, a specific marker for mature adipocytes

These sequences, and the phosphorothioate oligonucleotides represented by AAT12418-T12434 (which are complementary to regions of the mRNA 4 or 5 of herpes simplex virus 1 (HSV)), are effective in the prevention and treatment of viral infection. The sequences are especially effective against infection by HSV, HIV or varicella zoster virus (VZV)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This oligonucleotide, designated PRIMER 4 (reverse), is specific for a 2523 bp Mycobacterium tuberculosis chromosomal DNA region (see AAT93611). It was designed for use with PRIMER 3 (see AAT93617) to amplify a 377 bp region of DNA specifically from M. tuberculosis complex bacteria. No amplification product is obtained from other bacteria. Thus, the primers of the 377 bp region are useful for the rapid discrimination of M. tuberculosis complex (M. tuberculosis, Mycobacterium bovis, BCG, Mycobacterium africanum and Mycobacterium microti) from other mycobacteria. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                        New DNA and related proteins or RNA derived from M. tuberculosis - used for diagnosis of mycobacterial infections, monitoring vaccination and development of anti-mycobacterial agents.

This oligonucleotide probe is used in the confirmatory DNA sequencing of the PCR amplification of the tumour necrosis factor (TNF) gene. This probe is specific for the wild type TNF. A set of primers are used to amplify a 519 bp promoter fragment of the TNF and TNF-2 allele mutated at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Assessing cytokine therapy of a persistent virus infection, e.g hepatitis B virus - by determining presence of allele(s) associated with increased therapeutic response, e.g. tumour necrosis factor-2 allele.
                                                                                                                             The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (Preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (XDR) and/or foetal liver kinase 1 (flt-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 tumour necrosis factor; TNF; cytokine; hepatitis B virus; HBV; TNF-2; virus infection; interferon; therapy; promoter; PCR primer; TNF-alpha; allele; variant; hybridisation; probe; screening; genotyping; ss.

                                                                                                                                                                                                                                                                                                                 The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VECF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (fll-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour anglogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; VEGF, hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                   Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Mouse flk-1 VEGF receptor hammerhead ribozyme substrate #607.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Score 12.2; DB 1; Length 17;
